If the old motherboard have a fast processor and an empty PCIe slot X4, X8 or X16, is OK to "move" Win10 from SATA HDD (SSD) to NVMe (3X faster minimum) and use Clover to boot from the old drive. All work like a charm, Windows, games and other OS multiboot.

This. I can't boot directly from my NVMe via a PCIe adapter because of the BIOS. There have been reports that a modified BIOS for my board can handle booting from it, but I haven't the courage to attempt it. With that said, if you're running Linux, you only need /boot to be somewhere that's not your NVMe drive.

Of course, if a PCIe M.2 can be made to work, that will be faster. There are results for the Samsung 960 EVO NVMe, but it appears that all 4 tests using the 960 are probably the same system. But, if there are 4 tests and the high score is 13396 and the low score is 7126, this must be a description of experimentation. When adapting new technology

I experienced similar as you with an older system. I used a Vantec PCIe 4x adapter with a M.2 NVMe drive installed. I installed Win10 onto the drive but it would not boot. Initially I tried the Clone but that was not working either. Again unless the motherboard support NVMe booting you cannot boot to an NVMe drive.
