The superposition theorem is a derived result of the superposition principle suited to the network analysis of electrical circuits. The superposition theorem states that for a linear system (notably including the subcategory of time-invariant linear systems) the response (voltage or current) in any branch of a bilateral linear circuit having more than one independent source equals the algebraic ...

A hybrid electric vehicle (HEV) is a vehicle which is using two sources of energy for propulsion, one of them being electrical energy. Most of the road vehicles with hybrid powertrain use an internal combustion engine (ICE) combined with an electric machine (EM). Compared with a conventional vehicle, powered by an ICE, a hybrid electric vehicle is capable of performing these functions:

Kinetic energy is one of several types of energy that an object can possess. Kinetic energy is the energy of motion. If an object is moving, then it possesses kinetic energy. The amount of kinetic energy that it possesses depends on how much mass is moving and how fast the mass is moving. The equation is $KE = 0.5 * m * v^2$.

In intrinsic semiconductors, current flows due to the motion of free electrons as well as holes. The total current is the sum of the electron current I_e due to thermally generated electrons and the hole current I_h . Total Current (I) = $I_e + I_h$. For an intrinsic semiconductor, at finite temperature, the probability of electrons to exist in conduction band decreases exponentially with ...

Finally, adding the 9th harmonic, the fifth sine wave voltage source in our circuit, we obtain this result: Sum of 1st, 3rd, 5th, 7th and 9th harmonics approximates square wave. The end result of adding the first five odd harmonic waveforms together (all at the proper amplitudes, of course) is a close approximation of a square wave.
